Sustainability, Agriculture & the Environment

Water Harvesting and Lined Catchments

This fact sheet covers the basic considerations & steps involved in constructing a lined catchment. Maintaining a reliable & sustainable farm water supply is a major concern for livestock producers today.

Many farmers have invested in lined catchment areas across SA. A lined catchment is a poly lined catchment area that runs into a poly lined dam. A lined catchment will capture water in any rainfall or dew event, where as an earthen dam needs the soil profile to be fully wetted up for water to run off the catchment & into the dam.

The motivation for implementing a lined catchment area varies, but the most common reasons are;

- The cost of mains water.
- Low annual rainfall levels.
- Poor quality groundwater is not an option.
- Sandy soils are too porous to install earthen dams.
- Lined catchments produce high quality water suitable for use by all livestock, intensive agriculture, spraying, and domestic use.

Site selection and preparation

Some points to consider when selecting a site:

- A steep gradient is not required.
- A level area with a slight fall is ideal.
- Siting on elevated area, or the highest point in the landscape can negate water pumping costs.
- If this is not possible the location of storage tanks need to be considered.
- The catchment can be placed on land that is deemed otherwise unproductive.
- Can drains or roads run into the catchment area?

Poly Liners

There are a range of different quality liners including;

- High Density Polyethylene - HDPE
- Linear Low Density Polyethylene - LLDPE
- Polypropylene -PP and Poly Vinyl Chloride—PVC

High Density Polyethylene (HDPE) geomembrane, is a polyethylene thermoplastic. HDPE provide excellent durability and resistant properties due to its large strength to density ratio. This is the most common liner used in lined catchments.

Linear low-density polyethylene (LLDPE) geomembranes are very flexible, tear resistant and durable. LLDPE has a higher tensile break elongation than HDPE, however HDPE has an excellent ultraviolet (UV) and chemical resistance

What is the difference between HDPE and LLDPE Plastic Sheets?

- Although both materials are polyethylene, they do have different properties.
- LDPE is softer, more flexible and melts at a lower temperature than HDPE.
- HDPE is harder, has a higher chemical resistance and can withstand higher temperatures.

Poly liners come in a range of thicknesses, and qualities, most local catchments have used 1.5mm liners.

Planning and Regulation

Introduction

Regulatory requirements have been established primarily in response to issues that have arisen over the years that have created either environmental damage, over-use of resources, infrastructure damage or even conflict between land users. Often these issues were not foreseen, and as such the regulatory frameworks have been put in place to prevent or limit any such adverse impacts occurring. In regard to water harvesting the following may need to be considered as part of the overall plan (noting that this is based on livestock water used only).

Dams

Dams that do not meet certain exemption criteria will be required to be assessed as development. Depending upon the location, this might necessitate referral to the Landscapes SA Boards and or the Department for Environment, Water and Natural Resources. Impact on water resources and ecology are important considerations.

Dams are exempt from development approval, except:

- Where a levee or mound with a finished height greater than 3 metres above the natural ground is to be formed; or
- Where a retaining wall which retains a difference in ground levels exceeding 1 metre is to be used or formed; or
- Where the dam is in the Flood Zone or Flood Plain delineated by Council's Development Plan, or in any other zone or area shown as being subject to flooding or inundation in Council's Development Plan; or
- Where the dam is to have a capacity exceeding 5 megs.
- A dam is exempt from requiring development approval and it is used to collect or store surface water that it still requires a WAA permit. (Water Affecting Activity) the Department for Environment & Water, Water Licensing Branch.

Other Considerations

Shandyng Water

Stock do not need mains or rain quality water to thrive so there is the potential to mix water from the lined catchment and bore water.

This can significantly boost the water output from the lined catchment or reduce the area of the catchment or the size of the dam. The water produced just needs to be fit for purpose.

Water Quality

Stock grazing green feed can tolerate higher salt concentrations than the same stock on dry feed. Stock grazing saltbush or salty feeds are less tolerant to saline water than stock grazing other types of pasture. Pregnant, lactating and young stock have a lower salt tolerance than older dry stock.

Algae

Build up of algae in dams can not only block outlets and pipes but also taint the water. Several species of algae are toxic to stock and cause deaths from poisoning. Algae can be controlled with several chemicals, including copper sulphate, calcium hypochlorite and ferric alum.

Fire Risk

The area inside the exclusion fence is not grazed, & is a significant fire risk given the amount of pumps & electrical equipment on the site. Poly liners, tanks & pipes are at risk. Hazard reduction is recommended.

Estimation of potential water harvested

The figures below can be used as a guide in determining your total stock water requirements.

It should be noted however that the following are average figures and variations will occur depending on weather conditions, the feed available, and the breed of the animal.

Area		Rainfall		Volume captured	Value of same amount of SA Water mains supply \$3.214 kl (2024/2025)	Annual no of dry cows watered (13,500 l/head)	Annual no of cows & calves watered 20,000 l/head)	Annual no of dry sheep watered (2,070 l/head)	Annual no of lactating ewes watered (2,880 l/head)
1 sq m	X	1mm rain	=	1 litre					
0.5ha	X	450mm rain	=	2,250,000 litres (2.25 megs)	\$7,231	166	112	1,086	780
1 ha	X	450mm rain	=	4,500,000 litres (4.5 megs)	\$14,463	333	225	2,173	1,560
2 ha	X	450mm rain	=	9,000,000 (9 megs)	\$28,926	666	450	4,347	3,125
3 ha	X	450mm rain	=	13,500,000 (13 megs)	\$43,389	1,000	675	6,520	4,685
5 ha	X	450mm rain	=	22,500,000 (22.5 megs)	\$72,315	1,665	1,125	10,865	7,800

There is a potential to shandy bore water to increase output or reduce construction costs. The water just needs to be fit for purpose.

CASE STUDY ONE

Owner	'Orlunda Downs'	M & L Scobie
Property size		2,690ha
Location		Policemans Point
Rainfall		500mm
Enterprises	1,100 Cattle and 800 Sheep	
Annual water bill pre dam		\$40,000
Annual water bill post dam		< \$1,000
Catchment area		2.3ha
Catchment liner	Polydam	1.5mm HDPE
Dam Capacity		11 mega litres
Dam liner	Polydam	1.5mm HDPE
Shandyng water		yes
Year established		2016
Cost		\$250,000
Dam liner cost \$40,000 - Catchment liner cost \$120,000 (Includes freight and handling)		

Benefits

Mark has now switched off his water meter but has left it connected to his farm watering system as "insurance" in case of emergency.

Mark turning off his SA Water meter.

Commencing the instillation of the liner and the anchor trenches are clearly visible in the foreground.

Site selection was important and there is plenty of room to extend the catchment at a later date if necessary.

Excess rock was used around troughs and on roads
The site must be rock free or liner damage may occur

Poly liner initially weighed down with sandbags

The option to shandy bore water to increase the capacity of the lined catchment remains.
Water only needs to be fit for purpose and stock don't need pure rainwater to thrive.

Project Steps

- Business case.
- Site selection.
- Earthworks carried out to build the dam and shape the catchment area.
- The dam and catchment surface to be lined must be smooth and free of rocks, sharp stones, sticks, roots, sharp objects, or other debris prior to laying liner.
- Ensure the catchment site is level to minimise water pooling and evaporation.
- Placement of liner in dam and on catchment.
- Liner cannot be laid when hot or windy.
- The liner must be laid loosely as it will tighten, and move when the temperature fluctuates.
- Ensure the liner is stable, weighed down, and fully welded to stop poly liner from flapping.
- Welding of liner by contractors (if using purpose made poly liner).
- Fencing the site to prevent wildlife being trapped and damaging the liner.
- Setting up other water infrastructure as required eg. tanks, pumps, telemetry etc.

The whole site must be free of rocks and other debris otherwise liner damage may occur.

Concrete sump and outlet.

The liner needs to be weighed down to prevent lifting in the wind.

The site needs 1.8m high secure fencing.

Project Components

In approximate order of costs

1. Poly Liner	6. Water Pumps *
2. Earthworks	7. Remote Monitoring Telemetry*
3. Catchment Fencing	8. Pump Shed*
4. Tanks *	9. Sand Bags to weigh down liner
5. Power *	10. Tyres to weigh down liner

**May not be required at all sites*

A ladder into the dam is a useful safety feature.

Site selection is very important and it is advisable to do a test dig with a backhoe so there are no nasty surprises during construction.

CASE STUDY TWO

'Gundooee'		Nick Daniel
Location		Field
Property size		1,230 ha
Rainfall		450mm
Enterprises		Cattle
Annual water bill		\$28,000
Catchment area		12,200sq m
Dam area		3,200 sq m
Total area		1.54ha
Catchment liner	Fabtech	1mm HDPE
Dam Capacity		5 mega litres
Dam liner	Fabtech	1.5mm HDPE
Year established		2015

Challenges

Have had issues with algae, but it was easily treated with copper sulphate.

Benefits

SA Water meter now switched off.

It remains connected and could be switched on in case of emergency.

The only SA Water charge is the annual connection fee.

Cost

Poly Liner 12,200 sqm + dam 3,200 sqm	\$76,300
Earthworks	\$28,200
2 pumps & telemetry (SMS)	\$15,400
Tank and extra poly	\$15,400
Pump shed	\$250
Fence wire	\$2,200

Payback Period

Will capture 15,400 litres per millimetre rain, the lined catchment is working well.

450mm rain will produce 6,930kl or 6.93 megs.

This would equate to \$23,000 for an equivalent amount of mains water at the current price. (March 2020)

All joints double seam welded. The gap between the welds is pressure tested for any leaks.

Completed dam with floating pump.

Pump shed and storage tank.

Dam evaporation losses

Evaporation losses from the dam will be between 1.5m and 2.0m and need to be factored into calculating catchment area.

Covers are expensive, and are in the range of \$5 to \$8 per sq m. The cheapest option to address losses may be to dig the dam deeper to compensate for the evaporation loss.

Floating Dam Covers - Benefits:

- Evaporation control
- Blocks sunlight preventing algae
- Protects water from bird droppings, pollens, air born and animal borne particulates
- Can acts as a catchment area, water is diverted to a drainage system and stored in the dam.

Catchment liners can save evaporation losses but are very expensive. It may be more cost effective to dig the dam deeper or make the catchment larger to offset evaporation losses.

Factors to consider with dam covers:

- How stable will the cover/barrier be in high winds?
- How long will it last?
- Will it be stable when the dam is dry?
- Are there special requirements – at least one product requires 30cm or more of water in the dam at all times?
- Will it leach toxic substances into the water?
- How will it stand up to what is a corrosive environment – continual contact with water and air and some level of salinity; exposure to ultra-violet light that can degrade some plastics?
- Some products are easily and cheaply installed by the land owner, others require expensive installation by specialists.
- What warranty is there & is the company likely to be around in five years if you need to call on the warranty?
- Does the product need to cover only the water, or does it need to be large enough to allow for anchoring beyond the lip of your dam – making a big impact on the final price?
- Many of the products on the market are flammable. The probability of a bushfire during the life of the cover must be considered.

Fencing the lined catchment is essential to prevent trapped wildlife and livestock damaging the liner or drowning.
